To whomever it may concern,

I am interested in applying for an immunology position in your company. I currently attend Ripon High School as a junior, and I plan on attending a 4 year university with a major in immunology and then work towards my graduate degree. My hard work and creative mind in my studies, especially science courses, show excellent qualities for a immunology position.

I have always been interested in microbiology and human sciences. I have created a close bond with one of my high school's science teachers who graduated from Montana State University and got her bachelor's degree in microbiology. She worked in a lab for a few years studying MRSA and working with other diseases microscopically. In taking her classes I have become highly interested in all biology fields, especially immunologically based microbiology, studying the actual microbes that trigger immune responses and then manipulating your immune system to aid the problem. The information I have learned from my biology, AP biology, and anatomy classes have allowed me to come to the consensus that the immune system is the most interesting part of your body, which is why I am fit to pursue a job in this field.

Working as an immunologist will give me opportunities to sharpen my skills with the equipment used to discover immune system based infections and offer a team of scientists for me to collaborate with creating new ideas for the future of immunology.

Sincerely,

Gabriella Ilardi
